

Parts List

- 1 - Hard Drive Cage
- 2 - Mounting Screws

RDRIVECAGE

Quick Connect Guide

Drive Cage

1 Shut off power

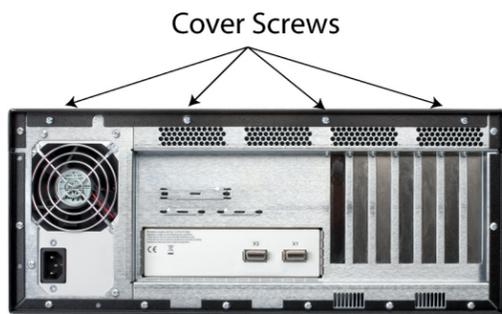

Shut down the host computer first and then the Expansion System before installing drive cage.

Wait 10 minutes before starting Step #2 to allow hot components to cool off.

Caution

2 Remove chassis cover

3 Remove Front Panel

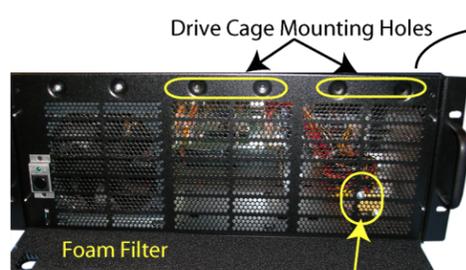

4 Identify Locations

- a** 5V Load Resistor
- b** RDRIVECAGE location #1 (All Systems)
- c** RDRIVECAGE location #2 (6 & 7-Slot Systems only)
[Location of 2nd Fan on 13-Slot Systems]

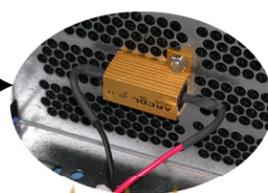

Mounting Screw Holes Behind Front Faceplate

5 Remove 5V Load Resistor

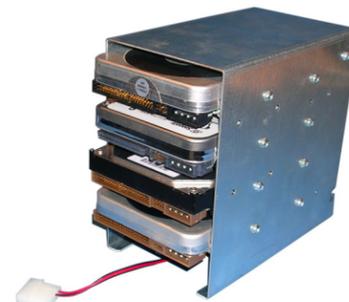

5V Load Resistor Retaining Screw

Make sure the 5V Load Resistor has had time to cool before touching.

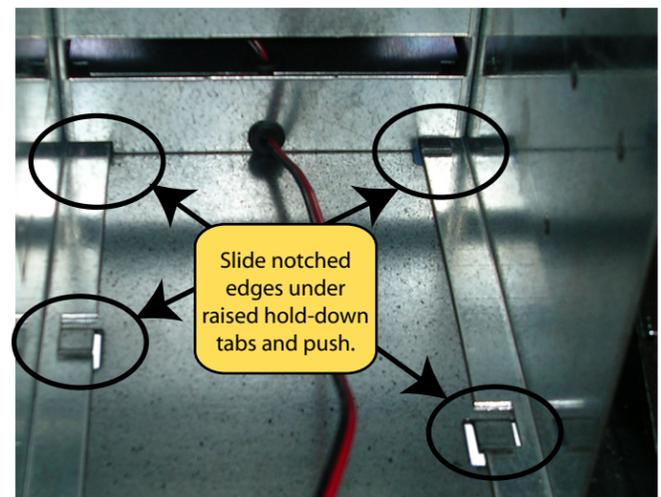

6 Install your hard drive(s)

Install with the fan side against the chassis front.

7 Slide RDRIVECAGE Into Position

Each drive cage mounts by sliding the four notches on the bottom edge of the cage under the "hold-down-tabs".

The MAGMA 6 and 7 Slot chassis can accommodate a drive cage in both positions **b** and **c**. The 13 Slot can only support a drive cage in position **b** because it has a 2nd fan in area **c**.

8 Secure RDRIVECAGE to chassis

Use the 2 screws included with your RDRIVECAGE kit and secure the drive cage to the chassis using the screw holes provided on the front of the chassis. See Step 5 for positions.

9 Connect your Cables

Connect the RDRIVECAGE fan power connector to the chassis power supply.

Add the hard drive controller card(s) and data cables.

Connect the hard drive power connectors to the chassis power supply.

10 Finishing Up

Replace the front panel and the cover.

Finally, turn on the chassis power, followed by the host computer and configure your hard drives.
